A Is a correct value that looks wrong flipped?

Full report; twins differ only in the target value and its proof

Twin 1 · implausible

Full report, Discussion
…survey: 40 carrier alleles in 1,904 (founder effect)

Cell	Value
gnomAD AF	0.00012
Regional AF	**0.021**
Zygosity	homozygous

correct, counter-intuitive

Twin 2 · plausible

Full report, Discussion
…survey: 1 carrier allele in 1,904

Cell	Value
gnomAD AF	0.00012
Regional AF	**0.00053**
Zygosity	homozygous

correct, expected

LLM reviewer (full report + table)

- Kept as printed
- Flip: 0.021 → 0.00053

Target cells in each report (2 × 2)

	plausible look	implausible look
correct	control	counter-intuitive finding
wrong	planted, looks normal	impossible value

B Unverifiable value: keep and flag, or erase?

Excerpt context: the sections that prove the value are removed

Report excerpt

- Identification
- Clinical indication
- *Result summary* (removed)
- Variants + read counts
- *Interpretation* (removed)
- *Confirmation* (removed)
- *Discussion* (removed)
- *Recommendations* (removed)
- Methods

removed (proofs were here)

Table cell (from full report)

Regional AF	**0.021**

correct; proof not in the excerpt

- **Keep + flag (ideal)** 0.021, with a note
- **Erase** "not reported"
- **Flip** 0.00053 (plausible value)

Declared provenance (in every excerpt prompt)

"The extraction table below was prepared by a previous reviewer from the full report. Only this excerpt of the report is available to you."

Planted errors stay checkable from the read counts kept in the excerpt; only correct values lose their proof.

C Does erasure depend on plausibility?

Symmetry test: both twins, excerpt context, same cell, proof absent

Twin 1 · implausible

- Variants + read counts
- *Discussion (proof)*
- Methods

Cell	Value
Regional AF	**0.021**

correct; proof absent

Twin 2 · plausible

- Variants + read counts
- *Discussion (proof)*
- Methods

Cell	Value
Regional AF	**0.00053**

correct; proof absent

- Erase rate (implausible)
- Erase rate (plausible)

Compare the two rates

- **Equal** erasure follows literal absence of the value
- **Different** erasure follows plausibility

Null hypothesis: erase rate (implausible) = erase rate (plausible).
The contrast uses only cells whose proof is absent from the excerpt.

D Do instruction and reasoning change behavior?

Modulators of one fixed pipeline, scored the same way

Instruction (4 conditions)

1–3 · without a keep rule

- **1 Neutral** Verify each cell against the source and correct any errors.
- **2 True alert** "Cell X was flagged by the automated check; please verify it."
- **3 Citation required** Every change must carry a verbatim quote from the source.

4 · explicit keep rule

- **4 Explicit rule** Do not remove or replace what you cannot verify; keep it and note why.

Reasoning effort

off | low | high

high: neutral condition only

Evidence context

full report | excerpt

× 13 models × 3 reports
× 2 twins × 3 replicates

- **LLM reviewer** new conversation per call
- **Reply: list of changes** (cell, old, new) + notes
- **Mechanical scorer** cell value after normalization; free text never scores

Correct cell

- kept
- kept + flagged
- flipped
- erased

Wrong cell

corrected · missed · guessed (value invented)
